### Outline

- Introduction
- Conclusions of field trials for mechanical weed control
- Challenges for mechanical intra-row weed control
- Camera-based control system of a hoe
- Prototype for intra-row weed control
- Preliminary results
- Outlook

Department for Agricultural Engineering  
Process Engineering in Plant Production

UNIVERSITÄT HOHENHEIM

### Introduction

#### *Integrated crop control*

- The rational application of a combination of biological, chemical, physical or plant- breeding measures

Physical measures:

direct action

indirect action

**The aim of the research project is to improve the  
mechanical weed control in sugar beet cultivation**

Department for Agricultural Engineering  
Process Engineering in Plant Production

UNIVERSITÄT HOHENHEIM

### Field trials for mechanical weed control

Employed technology:

Inter row: Inter- row cultivators  
 - 'L' Blades  
 - 'A' Blades

Intra row: Yetter rotary hoe  
 Finger weeder  
 Annaburger Turbo rotary hoe

Department for Agricultural Engineering  
Process Engineering in Plant Production

UNIVERSITÄT HOHENHEIM

### Field trials for mechanical weed control

Results of two years field trials:

- Successful inter-row weed control
- Problems to reduce weeds within the row

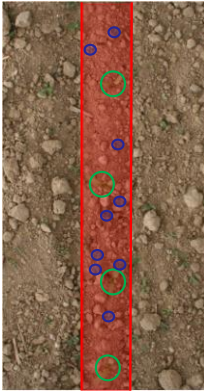

Department for Agricultural Engineering  
 Process Engineering in Plant Production

5

UNIVERSITÄT HOHENHEIM

### Challenges for mechanical intra-row weed control

Plant spaces within the row

- Disturbance of **beet** during early growth stages
- Competition for inputs/growth factors
- Retention force of the **beet** and the **weed** is nearly the same
- Yield losses

➔ **Sensor based mechanical intra-row weed control**

UNIVERSITÄT HOHENHEIM

### How large is the potential area to be cultivated?

theoretical overview:

Sugar beet

$A_t$  (area): 10.000 cm<sup>2</sup>       $A_{SB}$  = Area close to Sugar Beet crop  
 $A_{SB}$  (area) = 10 \* 28,3 cm<sup>2</sup> = 283 cm<sup>2</sup>      (mechanical weed control isn't possible)

Theoretically sensor based mechanical weed control on >95% of the area possible

UNIVERSITÄT HOHENHEIM

### Camera-based control system of a hoe

■ Most important requirements:

- a real time detection of the following plant position
- driving and working velocity  $\geq 1$  m/s
- theoretical seed plant position is adjustable between 14 and 20 cm
- sufficient hoeing of interspaces
- low losses of cultivated plants

UNIVERSITÄT HOHENHEIM

### Camera-based control system of a hoe

**CCD camera with daylight cut filter  
(wavelengths < 780 nm are filtered)**

- generated grey-level image provides a high contrast between plants and soil

**Image size: 576\*80 pixels**

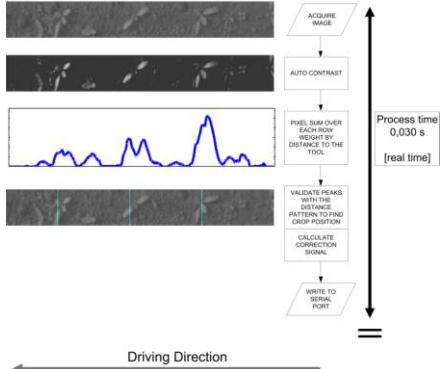

- CCD camera is triggered by an inductive proximity switch at each full rotation of the implement

### Camera-based control system of a hoe

Department for Agricultural Engineering  
Process Engineering in Plant Production

10 UNIVERSITÄT HOHENHEIM

### Single-row hoe prototype to control weed within the row in 2009

Department for Agricultural Engineering  
Process Engineering in Plant Production

11 UNIVERSITÄT HOHENHEIM

### Some Pictures of first field trials in 2009/2010

Department for Agricultural Engineering  
Process Engineering in Plant Production

12 UNIVERSITÄT HOHENHEIM

### Preliminary results

#### Image processing

- High detection rate of following plants > 90 %
- No defined lighting conditions necessary
- Imprecise seed placement and missing plants may cause problems in position detection

### Preliminary results

- The whole system fulfils the first requirements
  - a real time detection of the following plant position
  - operating speed  $\geq 1$  m/s
- Weed removal is made possible at a crucial growth stage of the sugar beet plants
- Limits of hydraulic drive has achieved at increasing operating speed !

### Outlook

Corollary of the problems with the hydraulic drive:  
Latest prototype

### Outlook

- Key benefits of the new electrical drive:
  - Higher velocity possible (responding behaviour of the new drive)
  - Electronic components more precise than hydraulic components
  - Data collecting without additional measurement instrumentation possible
  - Any implement-movement programmable

Outlook 2011/2012

- During cultivation season 2011: two field trials to evaluate the electric drive
- Comparison of newly developed system with standard methods of weed control
- Further Development of the image processing and mechanical components
